SCRIPT-CONTROLLED ACL – RESTRICT RECORD ACCESS BASED ON FIELD VALUE

Team ID: SWTID-2026-9980

Planning Logic / Sprint Planning

A Sprint is a fixed period or duration in which the team works to complete a set of project tasks.

An Epic is a large project task that is broken down into smaller user stories that can be completed over multiple sprints.

A Story is a small, specific task that is part of an Epic.

A Story Point represents the effort required to complete a story, using the Fibonacci-style scale.

1 – Very Easy 2 – Normal 3 – Moderate 5 – Difficult

Sprint 1 – ACL Foundation and Access Rules

User Story	Task	Story Points
USN1	Identify the target ServiceNow table and records that require field-based access control	2
USN2	Create/prepare the required user, role, and field-value test data	1
USN3	Define the access conditions based on the selected record field value	3
USN4	Create the Script-Controlled ACL and configure the appropriate operation	3
USN5	Write and validate the ACL script for allowing or denying record access	3

Total Story Points in Sprint 1 = 2 + 1 + 3 + 3 + 3 = 12

Sprint 2 – Testing, Validation and Documentation

User Story	Task	Story Points
USN6	Test access for records with permitted field values	2
USN7	Test access for records with restricted field values	2
USN8	Verify ACL behavior for different users/roles and record conditions	2
USN9	Handle unauthorized access and confirm that restricted records remain protected	4

USN10	Validate the complete Script-Controlled ACL workflow in ServiceNow	5
USN11	Document configuration, test cases, results, and project demonstration	5

Total Story Points in Sprint 2 = 2 + 2 + 2 + 4 + 5 + 5 = 20

Total Story Points and Velocity

Metric	Value
Sprint 1	12
Sprint 2	20
Total Story Points	32
Number of Sprints	2
Velocity = Total Story Points / Number of Sprints	32 / 2 = 16

Team Velocity = 16 Story Points per Sprint

Project: Script-Controlled ACL – Restrict Record Access Based on Field Value
